

Flat Panel Loudspeakers

MiniPro and MicroPro

SLR a division of Sound Leisure Ltd is pleased to confirm that they hold a General Licence from NXT which allows them to manufacture the MiniPro and MicroPro flat panel loudspeakers.

These flat panel loudspeakers offer many advantages over conventional loudspeaker designs, the sound is dispersed from the entire surface of the flat panel giving an omni-directional performance which spreads evenly across the entire listening area. These flat panel loudspeakers are available with a metal grille or without, if taken without a grille, this allows the panel surface to be used for decorative pictures or advertising/information material to be attached, giving both sound and signage from a single source.

MiniPro – High Power Full Range Portable Flat Panel Loudspeaker

The MiniPro will deliver an astonishing 89db continuous output from a power handling of 80 watts (AES). Originally designed for the mobile small band PA, the MiniPro has proven to be a huge success when hung in a room with a picture or advertising material on the panel surface delivering excellent quality music or exceptionally clear public announcements. It can also be placed on a tripod stand to for use in civic buildings, hotels, schools, churches etc. filling every corner of the room with 'even' sound.

Weighing less than 4 kilograms, these flat panel loudspeakers are easy to install, easy to transport (padded bags for travel protection are available) and easy to carry into those awkward venues at the top of a flight of stairs.

MicroPro Full range background music or public address flat panel loudspeaker

At no more than the size of an A4 sheet of paper, these flat panel loudspeakers can be used in visually sensitive areas and blend into any décor, they are supplied as standard with a stylish silver grille (other colours are available). The MicroPro, if purchased without a grille, then signage or decorative pictures can be added to the surface of the panel to give the speaker the invisibility often requested by interior designers.

The MicroPro is rated at only 20 watts, is extremely efficient and due to its surprising dispersion characteristics, fills unusually large areas with clean, clear non-directional sound.

These flat panel loudspeakers have to be seen and more important, heard, to be believed, flat panels have never sounded so good and with the advantage of being able to add pictures to the surface, loudspeakers as such, become invisible.
